In 1922, when Joseph-Armand Bombardier was fifteen years old he built his first snow vehicle. He had always loved to tinker with motors and make things go, and he dreamed of building a vehicle that could go over snow. His first attempt, using a Model T Ford engine and a wooden propeller, worked well. To Joseph-Armand's mind, anyhow. Not so much his father, who made him take the contraption apart. Over the years, Joseph-Armand dreamed of becoming a great mechanic and inventing machines. But when his young son died of a fever because it was impossible to get to the hospital over the snow-covered roads, Joseph-Armand applied his single-minded determination to building a vehicle that could go over snow. It took years, but he accomplished his goal. His invention changed the way people in snow country lived. Inaccessible roads could now be travelled, taking patients to hospitals, doctors and priests to the needy, children to school, and even mail to residents.

The need for continued research and development to enhance diesel engines is approaching the critical stage. Current and pending North American environmental regulations are placing efficiency and usage restrictions on the diesel which can only be overcome by understanding the interactions of the whole system. The lub oil evaluation (LOE) version of the Bombardier single-cylinder research engine (BSCRE) was designed and developed as an aid in understanding lubricating oils and their performances. This report describes the development of the BSCRE/LOE version, and the development of a turbocharger test rig. Both are requisite to medium-speed diesel engine research. Additional tasks completed included a comprehensive BSCRE users' documentation package and the addition of an atomic absorption spectrophotometer to the fuels and lubricants laboratory.
