Wind speed on the 1946 Beaufort scale is based on the empirical relationship: $v = 0.836 B^{3/2}$ m/s.

Where v is the equivalent wind speed at 10 metres above the sea surface and B is Beaufort scale number. For example, $B = 9.5$ is related to 24.5 m/s which is equal to the lower limit of "10 Beaufort". Using this formula the highest winds in ...

Beaufort scale - Wikipedia

Beaufort scale, in full Beaufort wind force scale, scale devised in 1805 by Commander (later Admiral and Knight Commander of the Bath) Francis Beaufort of the British navy for observing and classifying wind force at sea. Originally based on the effect of the wind on a full-rigged man-of-war, in 1838 it became mandatory for log entries in all ships in the Royal Navy.

Beaufort scale | Definition & Measurements | Britannica

Defining the Wind is a wonderfully written account of one man's crusade to learn about what the wind is made of by tracing the history of the Beaufort Scale and its eccentric creator, Sir Francis Beaufort. It's as much about the language we use to describe our world as it is an exhortation to observe it more closely.

Beaufort scale - Simple English Wikipedia, the free ...

The Beaufort scale remains valid for sailors of modern yachts who battle the elements. In 1759 a British civil engineer named John Smeaton designed an early anemometer as part of his study on windmill design. From readings and his experiments he defined an 8-point scale of winds.

The Beaufort Scale: Judging the Wind in Your Sails ...

Beaufort scale. [b? ?f?rt] A scale for classifying the force of the wind, ranging from 0 (calm) to 12 (hurricane). A wind classified as 0 has a velocity of less than 1.6 km (1 mi) per hour; a wind classified as 12 has a velocity of over 119 km (74 mi) per hour. Other categories include light air, five levels of breeze, four levels of gale, and storm.

Beaufort scale | Definition of Beaufort scale at ...

Definition The Beaufort wind force scale, usually referred to as just the Beaufort scale, was developed over 200 hundred years ago and is an empirical measure for describing wind intensity based on observed sea conditions. Vestiges of it are still used in marine forecasts around the world.
