A chatbot is expected to be capable of supporting a cohesive and coherent conversation and be knowledgeable, which makes it one of the most complex intelligent systems being designed nowadays. Designers have to learn to combine intuitive, explainable language understanding and reasoning approaches with high-performance statistical and deep learning technologies. Today, there are two popular paradigms for chatbot construction: 1. Build a bot platform with universal NLP and ML capabilities so that a bot developer for a particular enterprise, not being an expert, can populate it with training data; 2. Accumulate a huge set of training dialogue data, feed it to a deep learning network and expect the trained chatbot to automatically learn “how to chat”. Although these two approaches are reported to imitate some intelligent dialogues, both of them are unsuitable for enterprise chatbots, being unreliable and too brittle. The latter approach is based on a belief that some learning miracle will happen and a chatbot will start functioning without a thorough feature and domain engineering by an expert and interpretable dialogue management algorithms. Enterprise high-performance chatbots with extensive domain knowledge require a mix of statistical, inductive, deep machine learning and learning from the web, syntactic, semantic and discourse NLP, ontology-based reasoning and a state machine to control a dialogue. This book will provide a comprehensive source of algorithms and architectures for building chatbots for various domains based on the recent trends in computational linguistics and machine learning. The foci of this book are applications of discourse analysis in text relevant assessment, dialogue management and content generation, which help to overcome the limitations of platform-based and data driven-based approaches. In the West, a specific ideal for female genitalia has emerged: one of absence, a "clean slit," attained through the removal of pubic hair and, increasingly, through female genital cosmetic surgery known as FGCS. In The Perfect Vagina: Cosmetic Surgery in the Twenty-First Century, Lindy McDougall provides an ethnographic account of women who choose FGCS in Australia and the physicians who perform these procedures, both in Australia and globally, while also examining the environment in which surgeons and women come together. Physicians have a vested interest in establishing this surgery as valid medical intervention, despite majority medical opinion explicitly acknowledging that a wide range of genital variation is normal. McDougall offers a nuanced picture of why and how these procedures are performed and draws parallels between FGCS and anthropological discussions of female genital circumcision (cutting). Using the neologism biomedical, she argues that cosmetic surgery functions as both ritual and sacrifice due to its promise of transformation while simultaneously submitting the body to the risks and pain of surgery, thus exposing biomedicine as an increasingly cultural and commercial pursuit. The Perfect Vagina highlights the complexities involved with FGCS, its role in Western beauty culture, and the creation and control of body image in countries where self-care is valorized and medicine is increasingly harnessed for enhancement as well as health.
